# School for Design

Gecko Crypta provides privacy without reducing light transmission. This means that the rooms separated by a glass wall can be used in different ways.

## Starting Point

The Mason's Hall of the former Vocational School of Basel were redesigned and transformed into two distinct rooms, separated by a glass partition. The lively cafeteria area thereby conflicted with the lecture and examination area.

## Solution

Création Baumann's Gecko Crypta proved to be the ideal solution. This durable adhesive fabric offers reliable privacy assurance as well as being diaphanous – and the fleece structure emphasizes the character of the concrete building.
